

Contents

Part one - Forces shaping the container terminal sector

- 1 Introduction
- 2 Can container trade maintain rapid growth?
- 3 Increasing vessel sizes and port implications
- 4 International stevedoring
- 5 Terminal productivity
- 6 Forecast overview

Part two - Emerging issues

Introduction

- 1 Industry dynamics: emerging new industry structures
- 2 Industry reform - the effects of emerging rules and legislation
- 3 Competitive assessment of port-wide service and cost levels
- 4 Effective tendering of container terminals
- 5 The impact of growing influence of merchants on port strategy
- 6 Fifty ways to ease air pollution
- 7 Re-inventing the liner terminal
- 8 Sixty ways to ease port congestion

Glossary of terms

List of tables part one

- 2.1 World container port demand 1990-2006
- 2.2 World container port demand 1990-2006
- 2.3 Regional container port demand growth rates
- 2.4 Major container trades 2000-2006
- 2.5 Major container volumes 2000-2006
- 2.6 World Transshipment Container Port Demand 1995-2006
- 2.7 World transshipment demand 1995-2006
- 3.1 Representative vessel dimensions for large container vessels
- 3.2 Design development of large container vessels
- 3.3 Forecast vessel sizes by major container trades to 2015
- 3.4 Containerships: deepest laden draught, 1985-2006
- 3.5 Deepsea container ship trading costs - early 2007
- 3.6 The container feeder fleet
- 4.1 International stevedores - global port presence early 2007
- 4.2 Major shipping lines - global port presence early 2007
- 4.3 International stevedore development 1998-2007
- 5.1 Berth productivity in major container terminals
- 5.2 Land use productivity in major container terminals
- 6.1 EU GDP and container trade 1986-2006
- 6.2 World GDP and container trade 1991-2006
- 6.3 World GDP/container trade co-efficients 1992-2006
- 6.4 Further issues determining future containerport demand growth
- 6.5 Total world containerport demand by region to 2020
- 6.6 Forecast container port demand to 2020
- 6.7 Total world container port demand transshipment demand by Region to 2020

List of tables part two

- 1.1 Possible future industry structures
- 1.2 Top 20 global ocean freight forwarders
- 1.3 Distribution of publicly and privately operated container terminals
- 1.4 Level of control of global operators in container terminal interest
- 1.5 Level of control in terminal interests by global terminal operator
- 1.6 Top 20 container shipping lines
- 1.7 Overview of consortia changes
- 1.8 Vertical integration by shipping lines
- 1.9 Possible future industry scenarios
- 1.10 Current direction of industry structure
- 3.1 The interface role of a port
- 3.2 Total vessel port-time
- 3.3 Time differences following from port itinerary
- 3.4 Components of vessel port-time
- 3.5 Comparison of vessel port-times
- 3.6 Total time to interface
- 3.7 Components of interface time
- 3.8 Comparison of interface capacities
- 3.9 Total landside port-time
- 3.10 Components of land-side port-time
- 3.11 Hinterland service levels and costs
- 3.12 Comparing hinterland times
- 3.13 Components of hinterland time
- 3.14 Components of vessel port costs
- 3.15 Comparison of vessel port costs
- 3.16 Components of interface costs
- 3.17 Components of land-side costs
- 3.18 Example of the time involved for a truck driver
- 3.19 Components of hinterland transportation costs
- 3.20 Comparison of hinterland costs
- 3.21 Competitive assessment of total port transit times
- 3.22 Competitive assessment of built-up transit times and costs
- 3.23 How to improve the competitive position
- 4.1 Summary of tender objects
- 4.2 Summary of listed port / project objectives
- 4.3 Tender processes
- 4.4 Pre-qualification criteria
- 4.5 Evaluation and selection of proposals
- 4.6 Selection criteria and weight factors
- 4.7 Financial compensation schemes
- 5.1 Shipper/ consignee port selection criteria
- 5.2 Example of a hinterland network
- 5.3 Progressively increased intra-port traffic in scattered ports
- 5.4 Relation between number of terminals and port market share
- 6.1 Air pollution from ports compared to other sectors
- 6.2 Major contributors to port pollution
- 6.3 How shipping lines can reduce air pollution
- 6.4 Differences between automated terminal and on-wheels system
- 6.5 How container terminal operators can reduce air pollution
- 6.6 Pollution per ton-kilometre for landside transportation modes
- 6.7 How transport companies can reduce air pollution

- 6.8 Other ways to reduce air pollution
- 7.1 Simultaneous idle and waiting times at terminals
- 7.2 Instability of consortia
- 7.3 Overview of a hybrid terminal
- 7.4 Differences between multi-user, dedicated capacity and liner terminals
- 7.5 Characteristics of three dedicated concepts
- 7.6 Rate structure dedicated concept
- 7.7 Revenue structure dedicated concept including back-up

List of tables part two continued

- 8.1 The impact of port congestion to various parties
- 8.2 Relationship between GDP and container growth
- 8.3 Usual arrival/departure pattern
- 8.4 Example of a truck receipt /delivery pattern
- 8.5 What shippers and receivers can do to ease congestion
- 8.6 What shipping lines can do to ease congestion
- 8.7 Basics of dwell time incentives
- 8.8 What container terminal operators can do to ease congestion
- 8.9 What can be done in the hinterland
